

## How To Measure For your Gas Log Set

Be sure to only measure the usable floor space of your fireplace. Avoid measuring the space at the front of your fireplace which might only be there to accommodate glass doors or mesh screens, or space which could be cosmetic only, like a brick ledge.

Keep in mind that your gas logs require combustion and ventilation air on each side of the log kit. 3"-4" is recommended.

Your gas log kit will require a burner (included in most gas log sets) and you may decide to add a remote control system (sold separately). If you do decide to add a remote control system, an additional 3-4" will be required to accommodate the brain of the system. Remote control systems can be battery operated or hard wired.

- A = Front Width
- B = Back Width
- C = Depth
- D = Height
